

PROJECT TITLE: Implement Client Script and UI Policy (Incident)

TASK 1: CREATE UI POLICY ON INCIDENT

1. Introduction

ServiceNow provides different configuration features to control how information is entered and managed in an Incident record. A UI Policy is one of the important features used to control the behavior of fields on a form based on specific conditions.

In this task, a UI Policy is created for the Incident table. The policy is designed to respond when the Impact of an Incident is set to High. Based on this condition, specific field behavior can be controlled on the Incident form.

The UI Policy created in this task is named **High Impact Control**. It is applied to the Incident table and is activated so that the defined behavior is applied when the required condition is satisfied.

2. Problem Statement

Incident records require accurate and consistent information for effective incident management. When users enter Incident information manually, required information may sometimes be missed or entered inconsistently.

For example, an Incident with a High impact may require additional information before it can be properly handled. If the required fields are not controlled at the user interface level, users may submit incomplete Incident records.

To address this issue, a UI Policy can be used to apply specific field controls based on the Impact value. In this task, the UI Policy is configured to identify High-impact Incidents and apply the required field behavior.

3. Objectives

The main objectives of this task are:

- To create a UI Policy for the Incident table.
- To configure a UI Policy named **High Impact Control**.
- To apply the policy when the Impact field is set to High.
- To make the required field mandatory based on the condition.

- To configure the Assignment group field as mandatory.
- To enable the UI Policy using the Active option.
- To use Reverse if false so that the applied behavior is reversed when the condition is no longer true.
- To understand how UI Policies control Incident form behavior.

4. Skills and Technologies Used

The following ServiceNow concepts and skills are used in this task:

ServiceNow

ServiceNow is the platform used to configure and manage Incident records and their related behavior.

Incident Management

Incident Management is used for creating and managing Incident records. The UI Policy in this task is configured specifically for the Incident table.

UI Policy

A UI Policy is used to control the behavior of fields on a form based on a defined condition.

UI Policy Actions

UI Policy Actions are used to define how a particular field should behave when the UI Policy condition is satisfied.

Form Configuration

Form configuration is used to apply field-level behavior and ensure that Incident records contain the required information.

5. Task Description

The purpose of Task 1 is to create a UI Policy on the Incident table. The UI Policy is named **High Impact Control**.

The policy is configured with the following basic details:

- **Name:** High Impact Control
- **Table:** Incident
- **Active:** True
- **Field:** Impact
- **Operator:** is
- **Value:** 1 – High

When the Impact field of an Incident is set to High, the UI Policy condition becomes true. The policy then applies the configured field behavior.

The Assignment group field is configured as mandatory as part of the UI Policy configuration. The Reverse if false option is also enabled so that the field behavior can be reversed when the condition is no longer satisfied.

6. Activity 1: Create UI Policy

6.1 Login to ServiceNow

The first step is to log in to the ServiceNow instance using administrative or configuration access. Administrative access is required to create and configure UI Policies.

After logging in, the ServiceNow interface is displayed. The required configuration module can then be accessed from the navigation menu.

6.2 Navigate to UI Policies

To create the required UI Policy, navigate to:

System UI → UI Policies

The UI Policies module contains the existing UI Policies available in the ServiceNow instance.

6.3 Create a New UI Policy

After opening the UI Policies module, click the **New** button.

A new UI Policy form is displayed. The required information can then be entered into the form.

7. UI Policy Configuration

The UI Policy is configured with the following details.

7.1 Name

The name of the UI Policy is:

High Impact Control

This name represents the purpose of the policy. It indicates that the policy is intended to apply controls when an Incident has a High impact.

7.2 Table

The Table is selected as:

Incident

This ensures that the UI Policy applies to Incident records.

7.3 Active

The **Active** option is set to:

True

Activating the policy ensures that the configured behavior is applied when the condition is satisfied.

8. Configure the Condition

The condition determines when the UI Policy should be triggered.

The following condition is configured:

- **Field:** Impact
- **Operator:** is
- **Value:** 1 – High

This means that the UI Policy is triggered only when the Incident Impact is set to **High**.

The condition is important because it ensures that the configured field behavior is applied only to the appropriate Incident records.

9. Configure Assignment Group

As part of the UI Policy configuration, the **Assignment group** field is selected in the UI Policy Action.

The field is configured as **Mandatory**.

This means that when the Impact is High, the Assignment group must contain a value according to the configured UI Policy behavior.

Making the Assignment group mandatory helps ensure that a High-impact Incident contains the required assignment information.

10. Reverse If False

The **Reverse if false** option is set to **True**.

This option ensures that when the UI Policy condition is no longer satisfied, the field behavior applied by the policy can be reversed.

For example, when the Impact changes from High to another value, the mandatory behavior applied by the UI Policy is reversed.

This provides dynamic behavior on the Incident form.

11. Submit the UI Policy

After completing all the required configurations, the settings are reviewed carefully.

The following configuration should be verified:

- Policy name is **High Impact Control**.
- Table is **Incident**.
- Active is set to **True**.
- Condition is Impact is 1 – **High**.
- Assignment group is configured as mandatory.
- Reverse if false is set to **True**.

After verifying the configuration, click **Submit** to save the UI Policy.

12. Expected Result

After successfully creating the UI Policy, the **High Impact Control** policy becomes available for Incident records.

When the Impact field is set to **High**, the configured UI Policy behavior is applied to the Incident form.

The Assignment group field becomes mandatory according to the configured policy. When the condition is no longer satisfied, the Reverse if false setting allows the field behavior to return to its previous state.

13. Benefits

The UI Policy provides several benefits in Incident management.

First, it helps maintain consistent data entry by applying specific rules to Incident forms.

Second, it ensures that important information is provided for High-impact Incidents.

Third, it reduces the possibility of incomplete Incident records.

The policy also provides dynamic field behavior because the required behavior changes according to the Impact value.

Finally, the Reverse if false option helps maintain normal form behavior when the condition is no longer applicable.

14. Testing and Verification

The UI Policy can be verified by opening an Incident record and changing the Impact field.

When the Impact is changed to **High**, the configured UI Policy should be triggered.

The Assignment group field should become mandatory according to the configuration.

The Impact value can then be changed to another value to verify the Reverse if false behavior.

15. Result

The **High Impact Control** UI Policy was successfully configured for the Incident table.

The policy was created with the required condition, field behavior, active status, and reverse condition. The configuration demonstrates how ServiceNow UI Policies can be used to control Incident form behavior based on the Impact value.

16. Conclusion

Task 1 successfully demonstrates the creation and configuration of a UI Policy for the Incident table in ServiceNow. The **High Impact Control** policy uses the Impact field as its condition and applies specific behavior when the Incident has High impact.

The configuration of the Assignment group field as mandatory helps ensure that important Incident information is provided. The use of Reverse if false allows the form behavior to change dynamically when the condition is no longer satisfied.

Overall, this task provides practical knowledge of creating UI Policies and configuring conditional field behavior in ServiceNow Incident Management.
